

3-in-1 egg slicer

slices widthwise

slices lengthwise

makes wedges

to slice widthwise:

lift the top cutting surface and place egg on its side in the holder. the egg should be horizontal with the point going to the side. the shape of the holder will help guide the egg into the correct position. close the top cutting surface over the egg. slowly tip the unit to remove the sliced egg.

to slice lengthwise:

lift the cutting surface and place egg upright in the holder. the egg should be vertical (pointing upward). there is a deeper pocket within the holder, which allows the egg to stay in an upright position. close the top cutting surface over the egg. slowly tip the unit to remove the sliced egg.

to cut the egg into strips turn the egg 90° and repeat process.

to dice the egg, cut into strips and slice it widthwise.

to wedge:

lift cutting surfaces and place egg upright in the holder. the egg should be angled toward the cutting surface. there is a deeper pocket within the holder, which will allow the egg to stay in an upright position. it is important that the egg be angled, so the tip is centered with the crossed wires on the wedger. while leaving the top cutting surface open, close the wedge cutting surface over the egg. after cutting completely through, tip the unit and slowly remove the egg.
